## DETAILED ACTION

### *Claim Rejections - 35 USC § 112*

1. The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

2. Claims 1-12 are rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the written description requirement. The claim(s) contains subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed invention.

- With regard claim 1-6 and 11, the limitation of "wherein said means for producing carrier constellation information is adapted to produce for at least one respective carrier subset a set of parameter Values from which constellations of all carriers in said at least one respective carrier subset can be retrieved through interpolation." as recited has not been taught in the specification. The specification only teaches In the VDSL receiver RX, the DMT demodulator DMOD demodulates the correct amount of bits from the carriers  $f_0$  . . .  $f_{511}$ ,  $f_{512}$  . . .  $f_{1023}$ , . . . ,  $f_{3584}$  . . .  $f_{4095}$  since the demodulator DMOD is made aware of the bits and gains information directly by the constellation information transmitting arrangement BiGi\_TA. This information is supplied to the control terminal of the DMT demodulator DMOD.

- With regard claim 7-110 and 12, the limitation of "interpolating means adapted to retrieve constellations of all carriers in at least one respective carrier subset from a respective set of parameter values that forms part of said carrier constellation information." as recited has not been taught in the specification. The specification only teaches In the VDSL receiver RX, the DMT demodulator DMOD demodulates the correct amount of bits from the carriers  $f_0 \dots f_{511}$ ,  $f_{512} \dots f_{1023}$ ,  $\dots$ ,  $f_{3584} \dots f_{4095}$  since the demodulator DMOD is made aware of the bits and gains information directly by the constellation information transmitting arrangement BiGi\_TA. This information is supplied to the control terminal of the DMT demodulator DMOD.
